Student Portal

Module guide — what each section does, with a one-line example · October 10, 2026

Module	What it does
Dashboard	A single overview screen pulling together the student's scores and recent activity across every module. *Example: Shows resume score, ATS score, aptitude score, and recent activity at a glance when the student first logs in.*
Notifications	A live feed of portal updates — such as new questions being added — shown via the bell icon in the header; clicking one jumps straight to the relevant page. *Example: Get notified the moment a new Coding question is added, and clicking it opens that exact problem instead of just the practice page.*
Resume Analyzer	Upload a resume (PDF or Word) and get an AI-written analysis of its strengths and weaknesses. *Example: Upload a resume and receive feedback such as "Add quantifiable achievements to your Experience section."*
ATS Score	Scores a resume against Applicant Tracking System criteria for a chosen job role. *Example: Check a resume against a "Software Engineer" role and get a score like 78/100 plus missing keywords.*
Job Match	Compares a resume against a specific job description to show how well the two line up. *Example: Paste a real job posting and see the resume matches 65% of its listed required skills.*
Mock Interview	AI-led behavioural interview practice using STAR-style questions, with the answer scored and reviewed. *Example: Practice a "Teamwork" topic interview and get feedback like "Good example, but quantify the outcome."*
Communication	Evaluates a written answer to an interview-style question for clarity, grammar, and confidence. *Example: Submit an answer to "Tell me about yourself" and receive a Clarity Score and a Grammar Score.*
Technical Interview	AI-led technical Q&A chosen automatically from the student's selected job role, with each answer evaluated for correctness. *Example: Pick "Frontend Developer", answer questions on React and JavaScript, and get each one scored out of 100.*
Coding Practice	Solve coding problems in Java, Python, JavaScript, or C++, with submitted code compiled and run against real test cases. *Example: Solve "Reverse a String" in Java; the code is compiled and run against 5 visible and 2 hidden test cases.*

Module	What it does
Aptitude	Timed Quantitative, Logical Reasoning, and Verbal Ability tests with instant scoring and weak-area feedback. *Example: Take a 10-question “Logical Reasoning” test in 10 minutes and get an accuracy percentage and weak areas.*
Skill Recommendations	AI-suggested skills to focus on next, based on the student's weakest scores, with structured learning paths to follow. *Example: If the Coding score is weak, it suggests a learning path like “Data Structures Fundamentals” to work through.*
Performance	A historical view of every past score and attempt across all modules, so progress over time is visible. *Example: View a chart of the last 5 Aptitude test scores to see whether the trend is improving.*
Profile	Edit personal details and keep a running list of skills already known. *Example: Update a phone number and mark “React” as a skill already known, so recommendations skip it.*
